THE CRYPTO CHALLENGE CONTEST

**¿No HABLAS ESPAÑOL? – No
PROBLEMO!**

Author: Bart den Hartog

April 2012

Introduction

Cryptanalysis is largely language-independent and relies more on technique than on knowledge of a particular language.

A monoalphabetic substitution cipher was used to encrypt the Spanish plaintext on the next slide.

Typical Spanish letters like ñ, á, and é were mapped to n, a and e before encrypting, so only the 26 letters from a standard alphabet a-z were used.

The codeword is the surname of two famous cryptographers in capitals, without space: SURNAME1||SURNAME2.

Hint

Every language has its own letter frequency distribution.
